

"How much time it takes to run a function as "
the size of the input grows."

Const

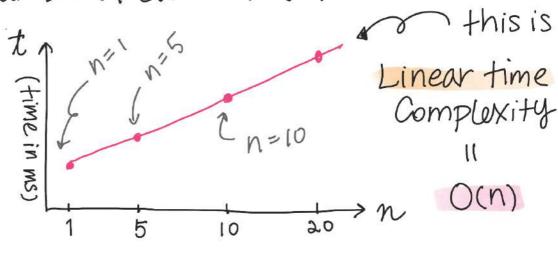

array1 = [\(\omega, \omega,

Let's see if there is a needle in the haystack!

(35) Const num Needles = (haystack, needle) > { let count=0 for (let i=0; haystack.length; i++) { if (haystack[i] = needle) Count +=1; & return count;

How long does it take to execute when the number of elements (n) is:

▼ execution time grows linearlyas array size increases:

@girlie_mac

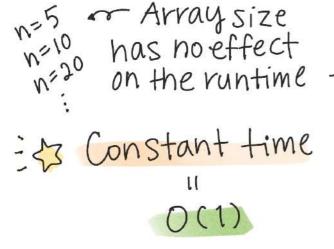

@girlie_mac

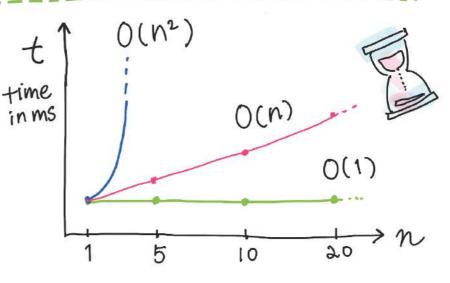

Let's see if we have some function that doesn't actually loop the array:

const always True No Matter What = (haystack) > { return true;

Quadratic time = 0 (n2) n=5, however

the runtime

Const

array 2 = [\(\omega, \omega,

proportional

Const has Duplicates = (avr) → { for (let i=0; i < arr. length; i++) Loop thru the array let item = arr [i]; it (arr. slice (i+1). index of (item)!==-1) {

, return true;

return false;

(2) Another arraylookup wl index of method

Data Structures

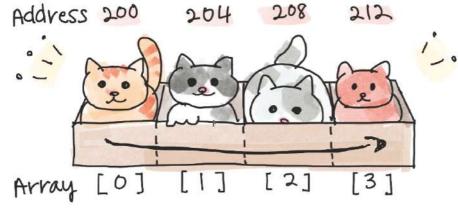

Array & Linked List

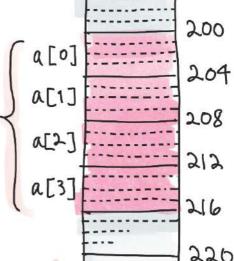

Grray

a linear data structure, stored in contiguous memory locations.

196

- ✓ Assume each is an integer

 = requires 4 bytes space
- ▼ The array of

 → must be allocated contiguously!

→ address 200 - 216

meh!

224

228

Byay!

 \sim can randomly access w/ index $\alpha[2] \rightarrow (\sim)$

wemory allocated = no memory overflow

of fixed size. Large space may not be avail for big array

= took the space! =

are costly.

> may need to create a new copy of the array + allocate at a new advess.

@girlie-mac

Data Structures

Linked list Array 6

Array & Linked List

: ★ a linear data structure

* each element is a separated object 4 elements are linked w/ pointers

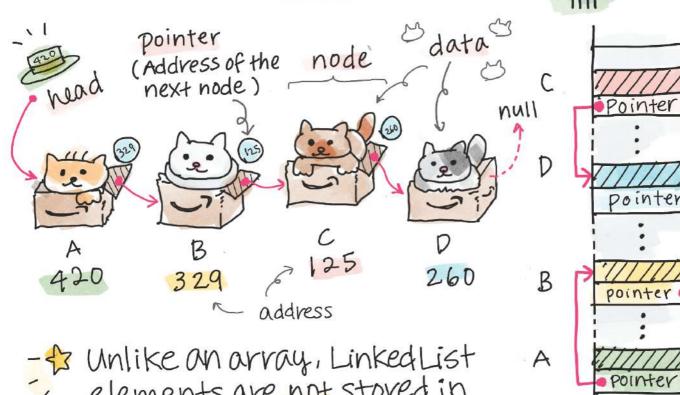

125

260

329

420

- Unlike an array, LinkedList elements are not stoved in Contiguous locations.

Dynamic data

= Size can grow or shrink

D'Insert & delete element ave flexible.

→ no need to shift nodes like array insertion

memory is allocated at runtime

meh!

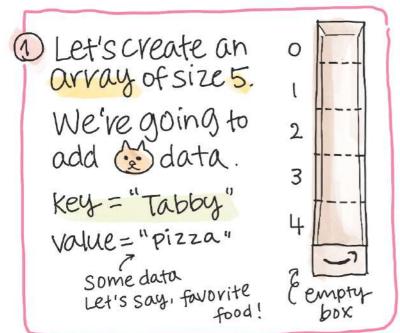

- @ No vandom access memory.
 - → Need to traverse n times
 - → time complexity is O(n). array is O(1)
- @ Reverse traverse is hard

Data Structures Hash Table

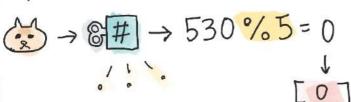

- 20 A hash table is used to index large amount of data = D Quick key-value look up. O(1) on average
 - La Faster than brute-force linear search

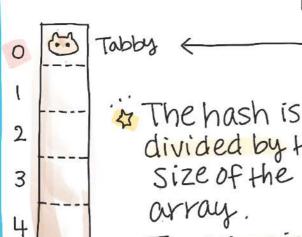

Calculate the hash value by using the Key. "Tabby". e.g. ASCII code, MD5, SHA1

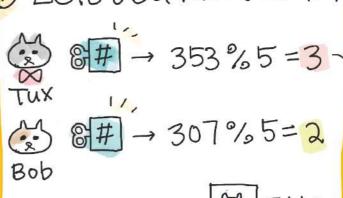

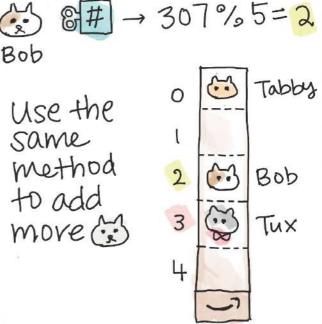

3 Use modulo to pick a position in the array!

divided by the Size of the The remainder is the Position! 1 Let's add move data.

agirlie_mac

3 Collision!

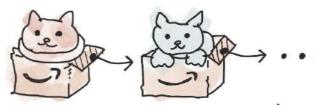

Now we want to add move data.

Let's add "Bengal"

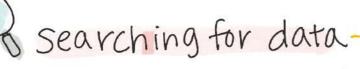

But [2] slot has been taken by "Bob" already! = collision! solet's Chain Bengal next to Bob! = chaining

key: "Bengal"

"Sphinx" "Fish + Value: "Dosa" Chips"

Keep adding data

Let's look up the value for Bob"

1) Get the hash → 307

2) Get the index -> 307 % 5 = 2

3 Look up Array [2] - found!

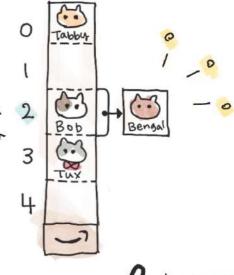

& Let's look up "munchkin"

1 Hash - 861

② Index → 861%5=1

3 Array[1] - "manx"

@ Operate a linear-search to find munchkin e Average O(n)

@girlie_mac
